

Data Analysis

Descriptive statistics of Quality Policy and Financial Performance

There is strategic quality planning of the long term quality journey			
		Frequency	Percent
Valid	Neither agree nor disagree	40	22
	Agree	79	44
	Strongly Agree	61	34
	Total	180	100

The above table shows the response of respondents regarding quality policy. It shows that most of the respondents (44%) agree that there is strategic planning of the long term quality journey in the organization. 22 % of the respondents were neutral and no respondent responded in negative.

Descriptive Statistics between Financial Performance and Quality Policy			
	N	Mean	Std. Deviation
Financial Performance	180	3.92	.21
Quality Policy	180	3.88	.57

The above table compares the means of financial Performance and quality Policy. It shows that financial policy has a mean of 3.92 which is very close to the mean of quality policy which is 3.88. This closeness of figures indicates that there is a close connection between quality policy and financial performance.

Descriptive statistics of reward and recognition and organizational effectiveness

There is appropriate reward and recognition for outstanding performance in the company			
		Frequency	Percent
Valid	Disagree (D)	40	22.2
	Neither agree nor disagree	60	33.3
	Agree	80	44.4
	Total	180	100.0

The above table shows the response of respondents regarding reward and recognition. It shows that most of the respondents (44%) agree that there is appropriate reward and recognition for outstanding performance in the company. 22 % of the respondents disagreed with the statement of the reward and recognition in the company.

Descriptive Statistics between reward and recognition and organizational effectiveness			
	N	Mean	Std. Deviation
Reward and recognition	180	3.44	1.04
Organizational Effectiveness	180	3.81	.63
Valid N (list wise) 180			

The above table compares the means of organizational effectiveness and reward and recognition. It shows that organizational effectiveness has a mean of 3.81 which is close to the mean of reward and recognition which is 3.44. This depicts a close connection between reward and recognition and organizational effectiveness.

Descriptive Analysis of Employee involvement and business performance

The organization encourage employees to suggest ideas for work improvement			
		Frequency	Percent
Valid	Strongly Disagree	40	22
	Agree	79	44
	Strongly Agree	61	34
	Total	180	100

The above table shows the response of respondents regarding Employee Involvement. It shows that most of the respondents (44%) agree that the organization encourage employees to suggest ideas for work improvement. 22 % of the respondents strongly disagree with this statement.

Descriptive Statistics between Employee Involvement and Business Performance			
	N	Mean	Std. Deviation
Employee Involvement	180	3.88	1.10
Business Performance	180	3.92	.78
Valid N (listwise) 180			

The above table compares the means of Employee involvement and Business performance. It shows that business performance has a mean of 3.92 which is near to the mean of employee involvement which is 3.88. This results indicate indicates that there is a close connection between employee involvement and business performance.

Model 1: Quality policy and financial performance

To check the effect of quality policy on financial performance we developed a model having independent variables of quality policy and top management commitment and financial policy as dependent variable. Linear regression was run which yielded the following results:

Model Summary				
Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.741 ^a	.549	.544	.14188
a. Predictors: (Constant), Quality Policy , Top Management Commitment				

ANOVA ^a						
Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	4.338	2	2.169	107.750	.000 ^b
	Residual	3.563	177	.020		
	Total	7.901	179			
a. Dependent Variable: Financial Performance						
b. Predictors: (Constant), (Constant), Quality Policy , Top Management Commitment						

Coefficients ^a						
Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	2.557	.114		22.497	.000
	Top Management Commitment	.108	.027	.218	4.039	.000
	Quality policy	.233	.020	.636	11.785	.000
a. Dependent Variable: Financial Performance						

To check the causal relationship between Quality Policy and financial performance we run a regression to see the causal relationship between our independent variables (quality

policy and top management commitment) and dependent variable (financial performance) on our data. The R-value in the Model Summary simply showing the correlation which is .741 having a high correlation value which indicates a high degree of correlation. The total variation in the dependent variable explained by the independent variable is 54% represented by R square. The table of ANOVA shows how well the regression equation fits the data. The model predicts the dependent variable significantly because the p-value is statistically significant at 0.00 level. The coefficient table shows that both the independent variables are statistically significant at 0.00 level. This means both quality policy and top management commitment significantly affect financial performance of the organization. As coefficients of both the independent variables are positive this means with increase in quality performance and top management commitment the financial performance also increases.

Model 2 : Employee involvement and business performance

Model Summary				
Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.993 ^a	.986	.986	.09368
a. Predictors: (Constant), Employee Involvement, Top Management Commitment				

ANOVA ^a						
Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	108.570	2	54.285	6185.200	.000 ^b
	Residual	1.553	177	.009		
	Total	110.123	179			
a. Dependent Variable: Business Performance						
b. Predictors: (Constant), Employee Involvement, Top Management Commitment						

Coefficients ^a						
Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
	(Constant)	.014	.074		.187	.852
	Top Management Commitment	.291	.017	.157	17.541	.000
	Employee Involvement	.687	.006	.968	108.034	.000
a. Dependent Variable: Business Performance						

To check the causal relationship between Employee involvement and business performance, we run a regression to see the causal relationship between our independent variables (Employee involvement and top management commitment) and dependent variable (business performance) on our data. The R-value in the Model Summary simply showing the correlation which is .993 having an extremely high correlation value which indicates a high degree of correlation. The total variation in the dependent variable explained by the independent variable is 98% represented by R square. The table of ANOVA shows how well the

regression equation fits the data. The model predicts the dependent variable significantly because the p-value is statistically significant at 0.00 level. The coefficient table shows that both the independent variables are statistically significant at 0.00 level. This means both employee involvement and top management commitment significantly affect business performance of the organization. As coefficients of both the independent variables are positive this means with increase in employee involvement and top management commitment the business performance also increases.

Model 3 : Reward and recognition and organizational effectiveness

Model Summary				
Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.993 ^a	.987	.987	.07281
a. Predictors: (Constant), Top management commitment , Reward and Recognition				

ANOVA ^a						
Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	70.667	2	35.333	6664.482	.000 ^b
	Residual	.938	177	.005		
	Total	71.605	179			
a. Dependent Variable: Organizational effectiveness						
b. Predictors: (Constant), Reward and recognition and Top management commitment						

Coefficients ^a						
Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	.325	.065		4.982	.000
	Reward and recognition	.626	.005	1.032	115.062	.000
	Top management commitment	.312	.013	.209	23.271	.000
a. Dependent Variable: Organizational effectiveness						

To check the causal relationship between reward and recognition and organizational effectiveness we run a regression to see the causal relationship between our independent variables (reward and recognition and top management commitment) and dependent variable (organizational effectiveness) on our data. The R-value in the Model Summary simply showing the correlation which is .993 having an extremely high correlation value which indicates a high degree of correlation. The total variation in the dependent variable explained by the independent variable is 98% represented by R square. The table of ANOVA shows how well the regression equation fits the data. The model predicts the dependent variable significantly because the p-value is statistically significant at 0.00 level. The coefficient table shows that both the independent

variables are statistically significant at 0.00 level. This means both reward and recognition and top management commitment significantly affect organizational effectiveness of the organization. As coefficients of both the independent variables are positive this means with increase in reward and recognition and top management commitment the organizational effectiveness also increases.
